Basement Regions

Basement Regions

A major area of interest in French geomorphology during the last quarter of a century has been to understand denudation chronologies and the legacies of environmental change in shield regions. The mechanisms and consequences on landform patterns of differential erosion in plutonic, metamorphic and related cover rocks have been approached from the double angle of structural landforms in the landscape and petrographical, mineralogical and geochemical analysis in the laboratory. The detailed study of layered igneous intrusions has been particularly helpful in making progress more generally in the understanding of crystalline landform configurations of basement terrains. The Laboratoire de Géographie Physique CNRS-URA 1161, now reformed as two research units (Paris: CNRS-UMR 8591, and Clermont-Ferrand: CNRS-UPRES A6042), and its precursor research group at the Sorbonne under the guidance of Pierre Birot, constituted the spawning ground for French research on the geomorphology of basement terrains. Alain Godard masterminded much of the research synthesised in this volume, which is based on a previously published edition in French. Yannick Lageat and Jean-Jacques Lagasque have not only upheld the spirit of this school of geomorphology but also introduced novel concepts and methods to the investigation of crystalline terrains. They have also maintained geomorphological research abreast of contemporary developments in the geosciences. Yanni Gunnell translated the original text into English, adapted the figures and introduced a measure of editing, updating and explicating in order to make the volume more accessible - not only to a non-francophone audience, but to an audience unfamiliar with the intellectual undercurrents and 30 years.
